Your discussion provides a strong link between Industry 4.0 adoption in pharmaceutical manufacturing and the growing importance of resilience under Industry 5.0. The example of the NotPetya cyberattack is particularly effective in illustrating how deeply interconnected systems can propagate failures across global supply chains, especially in highly regulated sectors such as pharmaceuticals.

Building on your argument, one key preventative measure would be the implementation of supply chain cyber risk management frameworks. As the NotPetya incident demonstrated, vulnerabilities often originate from third-party software providers rather than internal systems. Therefore, stricter vendor risk assessments, software validation, and continuous monitoring of external dependencies are essential in Industry 4.0 ecosystems.

Another critical measure is data integrity assurance, which is particularly important in pharmaceutical environments where regulatory compliance (e.g., GMP standards) depends on accurate and traceable data. The use of blockchain or distributed ledger technologies could enhance transparency and prevent data manipulation across interconnected systems. Additionally, segregation of critical manufacturing systems from corporate IT networks can reduce the spread of cyber threats.

From an Industry 5.0 perspective, your point on “rebalancing” is crucial. Embedding human-in-the-loop controls ensures that automated systems can be overridden when anomalies occur. Regular simulation exercises and digital twin testing could also help organisations anticipate failure scenarios and improve recovery strategies.

Overall, your analysis clearly demonstrates that resilience, cybersecurity, and human oversight must be integrated into system design, rather than treated as secondary considerations in digital transformation initiatives.
